

GLM PRESENTS TWO NEW TARGET ADAPTERS FOR LOCATION CHANGES.

RELOCATION SPECIAL

Every surveying job starts while searching good positions for relocation points. If there are no magnetic stable surfaces or the ground is very rough, the use of the adapters "Relocation special" is useful. By using these adapters, you get a stable relocation change.

RELOCATION TEMPORARILY

For long-running construction sites, it can be very useful to create a fixed-point network with 10-20 fixed nests. A more favorable variant can be implemented temporarily with "Relocation temporarily". Simply drill holes [6mm] to the desired positions on metal and equip with the 3 temporary nests on the measurement day. A centering pin helps you set up the individual points. After measurement, the magnetic nests can be removed again.
